

## **ERMI Knee Extensionater II®**

The ERMI Knee Extensionater II is a portable, easy-to-use device that allows patients with flexion contractures to work on improving extension at home, at work or just about anywhere they go. The device uses a comfortably fitting air cuff to accomplish overpressure therapy with more precision and without the discomfort of the traditional hanging of weights.

It uses ERMI's patented pneumatic air-bladder technology for moving arthrofibrotic joints. This device borrows from the time-tested protocols of overpressure therapy for treating extension loss. It provides the patient with complete control to add and remove load to the joint in very small increments to match the load required to stretch the soft-tissue restrictions in the joint.

Patient compliance is high with ERMI's Patient Actuated Serial Stretch (P.A.S.S.) protocol. With the ERMI Knee Extensionater II, as with all of ERMI's devices, patients typically see improvement very quickly after starting therapy. Rapid improvement creates enthusiasm for continuing with the treatment plan. Additionally, the short treatment time of 60 minutes per day is an appealing alternative to the longer protocols required by some mechanical therapy options.
